

4 Adding styles

In React, you specify a CSS class with `className`. It works the same way as the HTML [class](#) attribute:

```
<img className="avatar"/>
```

Then you write the CSS rules for it in a separate CSS file:

```
/* In your CSS */
```

```
.avatar {
```

```
border-radius: 50%;
```

```
}
```

React does not prescribe how you add CSS files. In the simplest case, you'll add a [<link>](#) tag to your HTML. If you use a build tool or a framework, consult its documentation to learn how to add a CSS file to your project.
